Class17: Obtaining and processing SRA datasets on AWS

Carly Chang (A16843962)

Downstream Analysis

```
library(tximport)

# setup the folder and filenames to read
setwd("/Users/carlychang/Desktop")
folders <- dir(pattern="SRR21568*")
samples <- sub("_quant", "", folders)
files <- file.path(folders, "abundance.h5" )
files

[1] "SRR2156848_quant/abundance.h5" "SRR2156849_quant/abundance.h5"
[3] "SRR2156850_quant/abundance.h5" "SRR2156851_quant/abundance.h5"
names(files) <- samples

txi.kallisto <- tximport(files, type = "kallisto", txOut = TRUE)

1 2 3 4</pre>
```

head(txi.kallisto\$counts)

```
SRR2156848 SRR2156849 SRR2156850 SRR2156851
ENST00000539570
                                      0.00000
ENST00000576455
                                 0 2.62037
ENST00000510508
                                 0.00000
                       0
                                     1.00000
ENST00000474471
                                                      0
ENST00000381700
                       0
                                      0.00000
                                                      0
                                 0.00000
ENST00000445946
```

We now have our estimated transcript counts for each sample in R. We can see how many transcripts we have for each sample:

```
colSums(txi.kallisto$counts)
```

```
SRR2156848 SRR2156849 SRR2156850 SRR2156851
2563611 2600800 2372309 2111474
```

And how many transcripts are detected in at least one sample:

```
sum(rowSums(txi.kallisto$counts)>0)
```

```
[1] 94561
```

Before subsequent analysis, we might want to filter out those annotated transcripts with no reads:

```
to.keep <- rowSums(txi.kallisto$counts) > 0
kset.nonzero <- txi.kallisto$counts[to.keep,]</pre>
```

And those with no change over the samples:

```
keep2 <- apply(kset.nonzero,1,sd)>0
x <- kset.nonzero[keep2,]</pre>
```

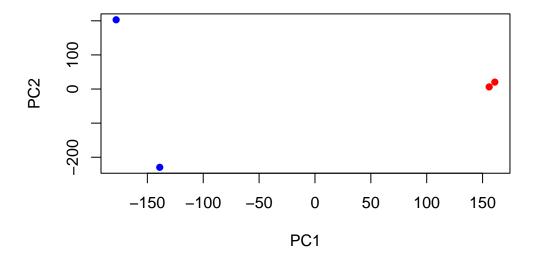

Principal Component Analysis

```
pca <- prcomp(t(x), scale=TRUE)
summary(pca)</pre>
```

Importance of components:

```
PC1 PC2 PC3 PC4
Standard deviation 183.6379 177.3605 171.3020 1e+00
Proportion of Variance 0.3568 0.3328 0.3104 1e-05
Cumulative Proportion 0.3568 0.6895 1.0000 1e+00
```

Now we can use the first two principal components as a co-ordinate system for visualizing the summarized transcriptomic profiles of each sample:

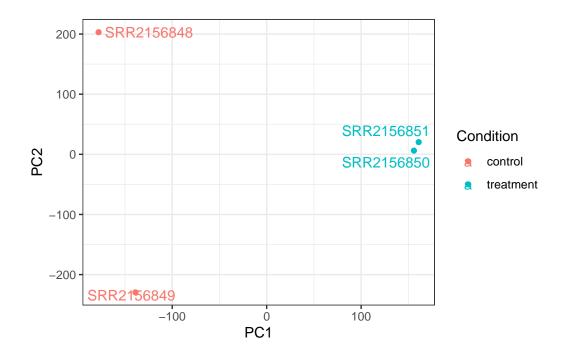

Q. Use ggplot to make a similar figure of PC1 vs PC2 and a seperate figure PC1 vs PC3 and PC2 vs PC3.

```
library(ggrepel)

# Make metadata object for the samples
colData <- data.frame(condition = factor(rep(c("control", "treatment"), each = 2)))
rownames(colData) <- colnames(txi.kallisto$counts)

# Make the data.frame for ggplot
y <- as.data.frame(pca$x)
y$Condition <- as.factor(colData$condition)

ggplot(y) +
   aes(PC1, PC2, col=Condition) +
   geom_point() +
   geom_text_repel(label=rownames(y)) +
   theme_bw()</pre>
```

```
ggplot(y) +
  aes(PC1, PC3, col=Condition) +
  geom_point() +
  geom_text_repel(label=rownames(y)) +
  theme_bw()
```
